get_row()

- Description
- Parameters
- Return
- Changelog
- Example
- Notes
  - Similarities to the_row()

Description

Returns an array containing all values (in the format name => value) for the current row within a `have_rows()` loop.

Parameters

```
get_row([$format_value = false]);
```

- `$format_value` *(bool) (Optional)* Whether to apply formatting logic. Defaults to false.

Return

(array) Array of values in the format name => value.

Changelog

- Added in version 5.3.3

Example

This example demonstrates how to load the current row values and display them.

```
<?php if( have_rows('slides') ): ?>
    <?php while( have_rows('slides') ): the_row();

        // Get all values for this row.
        $row = get_row();

        // Check for image value.
        if( $row['image'] ): ?>
            <img src="<?php echo $row['image']; ?>" />
            <p><?php echo $row['caption']; ?></p>
        <?php endif; ?>
    <?php endwhile; ?>
<?php endif; ?>
```

Notes

Similarities to the_row()

This function returns the same data as `the_row()`, however, it doesn’t step through the rows of a `have_rows()` loop.
