

has_sub_field()

- [Description](#)
 - [Parameters](#)
 - [Return](#)
 - [Change Log](#)
 - [Examples](#)
 - [Loop through Repeater field](#)
 - [Loop through a Flexible Content field](#)
 - [Loop through nested Repeater fields](#)
 - [Loop through nested Repeater fields \(from another \\$post ID\)](#)
-

Description

This function is deprecated. Please use the [have_rows\(\)](#) function instead.

This function is used within a while-loop to loop through each row of a Repeater or Flexible Content field.

Unlike `have_rows()`, this function will take a step through the available rows each time it is called, causing undesired results when also used within an if-statement.

Parameters

```
has_sub_field( $field_name, $post_id );
```

- `$field_name` (*string*) (*Required*) The name of the Repeater or Flexible Content field to be retrieved. e.g. 'gallery_images'
- `$post_id` (*mixed*) (*Optional*) The post ID where the value is saved. Defaults to the current post.

Return

(*bool*) True if a row exists.

Change Log

- Deprecated in version 4.3.0

Examples

Loop through Repeater field

This example demonstrates how to loop through a repeater field called “gallery_images”.

```
<?php if( get_field('gallery_images') ): ?>
    <?php while( has_sub_field('gallery_images') ): ?>
        " />
    <?php endwhile; ?>
<?php endif;
```

Loop through a Flexible Content field

This example demonstrates how to loop through a Flexible Content field called “content” and display various layouts.

```
<?php while( has_sub_field("content") ): ?>
    <?php if( get_row_layout() == "paragraph" ): ?>
        <div>
            <?php the_sub_field("content"); ?>
```

```

        </div>
<?php elseif( get_row_layout() == "file" ): ?>
    <div>
        <a href="<?php the_sub_field("file"); ?>" ><?php the_sub_field("name"); ?></a>
    </div>
<?php elseif( get_row_layout() == "featured_posts" ): ?>
    <div>
        <h2><?php the_sub_field("title"); ?></h2>
        <?php the_sub_field("content"); ?>
        <?php if( get_sub_field("posts") ): ?>
            <ul>
                <?php foreach( get_sub_field("posts") as $p ): ?>
                    <li><a href="<?php echo get_permalink($p->ID); ?>"><?php echo
get_the_title($p->ID); ?></a></li>
                <?php endforeach; ?>
            </ul>
        <?php endif; ?>
    </div>
<?php endif; ?>
<?php endwhile; ?>

```

Loop through nested Repeater fields

This example demonstrates how to loop through nested Repeater fields and display the sub field data.

```

<?php if( get_field('parent_repeater') ): ?>
    <?php while( has_sub_field('parent_repeater') ): ?>
        <div>
            <?php if( get_sub_field('child_repeater') ): ?>
                <ul>
                    <?php while( has_sub_field('child_repeater') ): ?>
                        <li><?php the_sub_field('item'); ?></li>
                    <?php endwhile; ?>
                </ul>
            <?php endif; ?>
        </div>
    <?php endwhile; ?>
<?php endif;

```

Loop through nested Repeater fields (from another \$post ID)

This example demonstrates how to loop through nested Repeater fields from a different post with the ID of 123.

Note: You don't need to specify the `$post_id` for any sub field functions.

```
<?php if( get_field('parent_repeater', 123) ): ?>
    <?php while( has_sub_field('parent_repeater', 123) ): ?>
        <div>
            <?php

            if( get_sub_field('child_repeater') ): ?>
                <ul>
                    <?php while( has_sub_field('child_repeater') ): ?>
                        <li><?php the_sub_field('item'); ?></li>
                    <?php endwhile; ?>
                </ul>
            <?php endif; ?>
        </div>
    <?php endwhile; ?>
<?php endif;
```
