Settings

- **Default Value**
  The default value shown when creating a new post.
- **Required**
  Found on the Validation tab, this requires a numeric value be provided as the input and prevents the field from accepting empty values. Defaults to off.
- **Minimum Value**
  The minimum value allowed.
- **Maximum Value**
  The maximum value allowed.
- **Instructions**
  Shows instructions when submitting data.
- **Placeholder Text**
  Appears within input when no value exists.
- **Step Size**
  The increment at which a numeric value can be set. Defaults to 1.
- **Prepend**
  Adds a visual text element before the input.
- **Append**
  Adds a visual text element after the input.

Template usage

Display value as text

This example demonstrates how to display a Number field value as text. We don't recommend outputting any ACF value without any sort of protection or escaping.

```
<p>To date, your efforts have raised $<?php echo esc_html( get_field('latest_total') );
?>!</p>
```

Display value within CSS

This example demonstrates how a Number field value named "h2_font_size" can be used to control the font size of all `<h2>` elements.

```
<?php

$h2_font_size = get_field('h2_font_size');
if( $h2_font_size ): ?>
<style type="text/css">
```

```
    h2 {
        font-size: <?php echo esc_html( $h2_font_size ); ?>px;
    }
</style>
<?php endif; ?>
```
