Settings

- **Required**
  Found on the Validation tab, this requires a valid password be provided as the input and

prevents the field from accepting empty values. Defaults to off.

- **Instructions**
  Shows instructions when submitting data.
- **Placeholder Text**
  Appears within input when no value exists.
- **Prepend**
  Adds a visual text element before the input.
- **Append**
  Adds a visual text element after the input.

Template usage

Get value

It’s unlikely you’re going to want to output password fields to the frontend, but rather use the value in other code. The following example shows how to load the value of the field “password” from an ACF options page.

```
$value = get_field( "password", "option");
```
