use-argspec-type-path

The AnsibleModule argument_spec knows of several types beyond the standard python types. One of these is `path`. When used, type `path` ensures that an argument is a string and expands any shell variables and tilde characters.

This test looks for use of `os.path.expanduser <python:os.path.expanduser>` in modules. When found, it tells the user to replace it with `type='path'` in the module's argument_spec or list it as a false positive in the test.
