Redirect admin area requests to HTTPS

import { Example } from "~/components";

This example single redirect for zone `example.com` will redirect requests for the administration area of a specific subdomain (`store.example.com`) to HTTPS, keeping the original path and query string.

When incoming requests match

- **Wildcard pattern**
  - **Request URL**: `http://store.example.com/admin*`

Then

- **Target URL**: `https://store.example.com/admin${1}`
- **Status code:** *301*
- **Preserve query string:** Enabled

For example, the redirect rule would perform the following redirects:

Request URL	Target URL	Status code
`http://store.example.com/admin/products/`	`https://store.example.com/admin/products/`	`301`
`https://store.example.com/admin/products/`	(unchanged)	n/a
`http://store.example.com/admin/?logged_out=true`	`https://store.example.com/admin/?logged_out=true`	`301`
`http://store.example.com/?all_items=true`	(unchanged)	n/a
`http://example.com/admin/`	(unchanged)	n/a
