

Discourse Developer Testing Guide

- [MailHog](#)

Some notes about testing Discourse:

MailHog

Discourse depends heavily on (sending) email for notifications. We use [MailHog](#) to test emails. It's super convenient!

“ MailHog runs a super simple SMTP server which catches any message sent to it to display in a web interface. Run mailhog, set your favourite app to deliver to `smtp://127.0.0.1:1025` instead of your default SMTP server, then check out `http://127.0.0.1:8025` to see the mail that's arrived so far.
