Control Enqueue

□□

- Enqueue Method

Controls can register and enqueue scripts & styles used by the control.

Enqueue Method

If you need to use an external library or some custom JS/CSS, you can do that by registering scripts using the `enqueue()` method:

```
class Elementor_Test_Control extends \Elementor\Base_Control {

□protected function enqueue(): void {

□□// Styles
□□wp_register_style( 'control-style', plugins_url( 'assets/css/control-style.css', __FILE__ ) )
□□wp_enqueue_style( 'control-style' );

□□// Scripts
□□wp_register_script( 'control-script', plugins_url( 'assets/js/control-script.js', __FILE__ )
);
□□wp_enqueue_script( 'control-script' );

□}

}
```
