

OAuth2 provider

- [Pre-registered applications](#)

Pre-registered applications

The following OAuth2 applications are pre-registered because it is generally useful for Forgejo to be an OAuth2 provider for the corresponding third party software. Their usage is explained in the [Forgejo user guide](#).

- **git-credential-manager** is the name of the OAuth2 application for the [Git Credential Manager](#) (a Git [credential helper](#))
- **git-credential-oauth** is the name of the OAuth2 application for the [git-credential-oauth](#) (a Git [credential helper](#))

All pre-registered applications are activated by default in the `[oauth2].DEFAULT_APPLICATIONS` setting as displayed in the `/admin/applications` page.

The screenshot shows the Forgejo Admin Settings page. The left sidebar contains a menu with items: Admin Settings, Dashboard, Identity & Access, Code Assets, Integrations, Applications, Webhooks, Actions, Configuration, and System Notices. The main content area is titled 'Applications' and contains the following information:

- A heading: 'OAuth2 applications gives your third-party application access to user accounts on this instance.'
- A table listing pre-registered applications:

Application Name	Client ID	Status
git-credential-oauth	a4792ccc-144e-407e-86c9-5e7d8d9c3269	Locked
Git Credential Manager	e90ee53c-94e2-48ac-9358-a874fb9e0662	Locked
- A section titled 'Create a new OAuth2 Application' with a form for 'Application Name' and 'Redirect URIs. Please use a new line for every URI.'
