Profile customization

By default, the profile page of a user (or an organization) is the list of repositories they own. It is possible to customize it with a short description that shows to the left, under their avatar. It can also be fully personalized with a markdown file that is displayed instead of the list of repositories.

Profile page

It uses the `README.md` file from the `.profile` repository of the user (or organization), if it exists.

If the `.profile` repository contains a FUNDING file with valid entries, then a "Donate" button is displayed as well, which users may select to view a list of configured donation options for the user (or organization).

Forked `.profile` repositories do not display profile content - only regular `.profile` repositories (not forks) will be used to populate the profile page. If you want to use content from a forked `.profile` repository, convert the fork to a regular repository in the "Danger Zone" section of repository settings.

Profile README.md

Making the `.profile` repository private will hide the Profile README and donation options.

Rather than supporting multiple social links on the profile card, under the user avatar, such links - including `rel=me` attributes - can be placed in the `.profile` README instead. This gives a user a lot of flexibility on how they wish to display these links. To add a `rel=me` attribute, the link should be written in HTML, rather than in Markdown format, for example: `<a rel="me" href="https://social.example.com/@username">Fediverse</a>`.
