1.6.2.2

GIT v1.6.2.2 Release Notes ==========================

Fixes since v1.6.2.1 --------------------

- A longstanding confusing description of what --pickaxe option of git-diff does has been clarified in the documentation.
- "git-blame -S" did not quite work near the commits that were given on the command line correctly.
- "git diff --pickaxe-regexp" did not count overlapping matches correctly.
- "git diff" did not feed files in work-tree representation to external diff and textconv.
- "git-fetch" in a repository that was not cloned from anywhere said it cannot find ’origin’, which was hard to understand for new people.
- "git-format-patch --numbered-files --stdout" did not have to die of incompatible options; it now simply ignores --numbered-files as no files are produced anyway.
- "git-ls-files --deleted" did not work well with GIT_DIR&GIT_WORK_TREE.
- "git-read-tree A B C..." without -m option has been broken for a long time.
- git-send-email ignored --in-reply-to when --no-thread was given.
- ’git-submodule add’ did not tolerate extra slashes and ./ in the path it accepted from the command line; it now is more lenient.
- git-svn misbehaved when the project contained a path that began with two dashes.
- import-zips script (in contrib) did not compute the common directory prefix correctly.
- miscompilation of negated enum constants by old gcc (2.9) affected the codepaths to spawn subprocesses.

Many small documentation updates are included as well.
