1.7.0.3

Git v1.7.0.3 Release Notes ==========================

Fixes since v1.7.0.2 --------------------

- Object files are created in a more ACL friendly way in repositories where group permission is ACL controlled.
- "git add -i" didn’t handle a deleted path very well.
- "git blame" padded line numbers with one extra SP when the total number of lines was one less than multiple of ten due to an off-by-one error.
- "git fetch --all/--multi" used to discard information for remotes that are fetched earlier.
- "git log --author=me --grep=it" tried to find commits that have "it" or are written by "me", instead of the ones that have "it" *and* are written by "me".
- "git log -g branch" misbehaved when there was no entries in the reflog for the named branch.
- "git mailinfo" (hence "git am") incorrectly removed initial indent from paragraphs.
- "git prune" and "git reflog" (hence "git gc" as well) didn’t honor an instruction never to expire by setting gc.reflogexpire to never.
- "git push" misbehaved when branch.<name>.merge was configured without matching branch.<name>.remote.

And other minor fixes and documentation updates.
