1.7.6.3

Git v1.7.6.3 Release Notes ==========================

Fixes since v1.7.6.2 --------------------

- "git -c var=value subcmd" misparsed the custom configuration when value contained an equal sign.
- "git fetch" had a major performance regression, wasting many needless cycles in a repository where there is no submodules present. This was especially bad, when there were many refs.
- "git reflog $refname" did not default to the "show" subcommand as the documentation advertised the command to do.
- "git reset" did not leave meaningful log message in the reflog.
- "git status --ignored" did not show ignored items when there is no untracked items.
- "git tag --contains $commit" was unnecessarily inefficient.

Also contains minor fixes and documentation updates.
