interactive

interactive.singleKey
When set to true, allow the user to provide one-letter input with a single key (i.e., without hitting the Enter key) in interactive commands. This is currently used by the `--patch` mode of linkgit:git-add[1], linkgit:git-checkout[1], linkgit:git-restore[1], linkgit:git-commit[1], linkgit:git-reset[1], and linkgit:git-stash[1].

interactive.diffFilter
When an interactive command (such as `git add --patch`) shows a colorized diff, git will pipe the diff through the shell command defined by this configuration variable. The command may mark up the diff further for human consumption, provided that it retains a one-to-one correspondence with the lines in the original diff. Defaults to disabled (no filtering).
