wrap-svg-content

- wrapSVGContent()
  - Usage
  - Example

```
title: wrapSVGContent() in Iconify Utils
functions:
  mergeDefsAndContent: './merge-defs-and-content.md'
  splitSVGDefs: './split-svg-defs.md'
  iconToSVG: './icon-to-svg.md'
  buildParsedSVG: './build-parsed-svg.md'
  convertParsedSVG: './convert-parsed-svg.md'
```

wrapSVGContent()

This function is part of Iconify Utils package.

Function `[func]wrapSVGContent()` wraps icon body in custom code.

It is used by `[func]iconToSVG()` to apply flip and rotation to icon, by `[func]buildParsedSVG()` and `[func]convertParsedSVG()` to move presentational attributes from `[tag]svg` element to a group element.

Usage

This function has the following parameters:

- `[prop]body`, `[type]string`. Icon content.
- `[prop]start`, `[type]string`. Start of wrapper, such as `[tag]<g>`.
- `[prop]end`, `[type]string`. End of wrapper, such as `[tag]</g>`.

This function extracts definitions from icon content, merges the rest of icon as `[str]start + content + end`, merges it with previously extracted definitions.

Example

```
src: libraries/utils/split-svg-defs.ts
title: 'example.ts'
```
