Document: createTextNode() method

- Syntax
  - Parameters
  - Return value
- Examples
- Specifications
- Browser compatibility

Creates a new Text node. This method can be used to escape HTML characters.

Syntax

```
createTextNode(data)
```

Parameters

- `data`
  - : A string containing the data to be put in the text node.

Return value

A Text node.

Examples

```
<button>YES!</button>
<button>NO!</button>
<button>WE CAN!</button>

<hr />

<p id="p1">First line of paragraph.</p>
```

```
function addTextNode(text) {
  const newText = document.createTextNode(text);
  const p1 = document.getElementById("p1");

  p1.appendChild(newText);
}

document.querySelectorAll("button").forEach((button) => {
  button.addEventListener("click", (event) => {
    addTextNode(`${event.target.textContent} `);
  });
});
```
