Document: images property

- Value
- Usage notes
- Examples
- Specifications
- Browser compatibility

The `images` read-only property of the Document interface returns a collection of the images in the current HTML document.

Value

An HTMLCollection providing a live list of all of the images contained in the current document. Each entry in the collection is an HTMLImageElement representing a single image element.

Usage notes

You can use either JavaScript array notation or the item() method on the returned collection to access the items in the collection. The following are equivalent:

```
firstImage = imageCollection.item(0);

firstImage = imageCollection[0];
```

Examples

This example looks through the list of images and finds those named `"banner.gif"`.

```
for (const image of document.images) {
  if (image.src === "banner.gif") {
    console.log("Found the banner");
  }
}
```
