- Specifications
- Browser compatibility
- See also

The **`clientHeight`** read-only property of the Element interface is zero for elements with no CSS or inline layout boxes; otherwise, it's the inner height of an element in pixels. It includes padding but excludes borders, margins, and horizontal scrollbars (if present).

`clientHeight` can be calculated as: CSS `height` + CSS `padding` - height of horizontal scrollbar (if present).

When `clientHeight` is used on the root element (the `<html>` element), (or on `<body>` if the document is in quirks mode), the viewport's height (excluding any scrollbar) is returned.

Value

An integer.

Examples

How clientHeight property determines the inner height of an element considering the height and pa
