Element: webkitmouseforcedown event

- Syntax
- Event type
- Specifications
- Browser compatibility
- See also

After a mousedown event has been fired at the element, if and when sufficient pressure has been applied to the mouse or trackpad button to qualify as a "force click," Safari begins sending `webkitmouseforcedown` events to the element.

`webkitmouseforcedown` is a proprietary, WebKit-specific event. It is part of the Force Touch events feature.

Syntax

Use the event name in addEventListener():

```
addEventListener("webkitmouseforcedown", (event) => { })
```

Alternatively, assign to the event handler property of the interface:

```
onwebkitmouseforcedown = (event) => { }
```

Event type

A MouseEvent. Inherits from UIEvent and Event.

Specifications

Not part of any specification. Apple has a description at the Mac Developer Library.
