Headers: delete() method

- Syntax
  - Parameters
  - Return value
- Examples
- Specifications
- Browser compatibility
- See also

The **`delete()`** method of the Headers interface deletes a header from the current `Headers` object.

For security reasons, some headers can only be controlled by the user agent. These headers include the forbidden request headers and forbidden response header names.

Syntax

```
delete(name)
```

Parameters

- `name`
  - : The name of the HTTP header you want to delete from the `Headers` object.

Return value

None (undefined).

Examples

Creating an empty `Headers` object is simple:

```
const myHeaders = new Headers(); // Currently empty
```

You could add a header to this using Headers.append:

```
myHeaders.append("Content-Type", "image/jpeg");
myHeaders.get("Content-Type"); // Returns 'image/jpeg'
```

You can then delete it again:

```
myHeaders.delete("Content-Type");
myHeaders.get("Content-Type"); // Returns null, as it has been deleted
```

Specifications

Browser compatibility
