Window: appinstalled event

- Syntax
- Event type
- Examples
- Specifications
- Browser compatibility

The `appinstalled` event of the Web Manifest API is fired when the browser has successfully installed a page as an application.

This event is not cancelable and does not bubble.

Syntax

Use the event name in addEventListener():

```
addEventListener("appinstalled", (event) => { })
```

Alternatively, assign to the event handler property of the interface:

```
onappinstalled = (event) => { }
```

Event type

A generic Event.

Examples

You can use the `appinstalled` event in an addEventListener method:

```
window.addEventListener("appinstalled", () => {
  console.log("Thank you for installing our app!");
});
```

Or use the `onappinstalled` event handler property (but note that this replaces other event listeners added using `onappinstalled`, if any):

```
window.onappinstalled = () => {
  console.log("Thank you for installing our app!");
};
```
