- See also

The `launchQueue` read-only property of the Window interface provides access to the LaunchQueue class, which allows custom launch navigation handling to be implemented in a progressive web app (PWA), with the handling context signified by the `launch_handler` manifest field `client_mode` value.

The custom launch navigation handling functionality is controlled by the properties of the LaunchParams object passed into the LaunchQueue.setConsumer() callback function.

Value

A LaunchQueue object instance.

Examples

```
if ("launchQueue" in window) {
  window.launchQueue.setConsumer((launchParams) => {
    if (launchParams.targetURL) {
      const params = new URL(launchParams.targetURL).searchParams;
```

```
      // Assuming a music player app that gets a track passed to it to be played
      const track = params.get("track");
      if (track) {
        audio.src = track;
        title.textContent = new URL(track).pathname.substring(1);
        audio.play();
      }
    }
  });
}
```

Specifications
