Window: offline event

- Syntax
- Event type
- Event handler aliases
- Examples
- Specifications
- Browser compatibility
- See also

The **`offline`** event of the Window interface is fired when the browser has lost access to the network and the value of Navigator.onLine switches to `false`.

Syntax

Use the event name in addEventListener():

```
addEventListener("offline", (event) => { })
```

Alternatively, assign to the event handler property of the interface:

```
onoffline = (event) => { }
```

Event type

A generic Event.

Event handler aliases

In addition to the `Window` interface, the event handler property `onoffline` is also available on the following targets:

- HTMLBodyElement
- HTMLFrameSetElement
- SVGSVGElement

Examples

```
// addEventListener version
window.addEventListener("offline", (event) => {
  console.log("The network connection has been lost.");
});

// onoffline version (but note that this replaces other event listeners
// added using onoffline, if any)
window.onoffline = (event) => {
  console.log("The network connection has been lost.");
};
```

Specifications

Browser compatibility
