- Browser compatibility
- See also

The `Window.resizeTo()` method dynamically resizes the window.

Syntax

```
resizeTo(width, height)
```

Parameters

- `width`
  - : An integer representing the new outerWidth in pixels (including scroll bars, title bars, etc.).
- `height`
  - : An integer value representing the new outerHeight in pixels (including scroll bars, title bars, etc.).

Return value

None (undefined).

Examples

This function resizes the window so that it takes up one quarter of the available screen. See the Screen.availWidth and Screen.availHeight properties.

```
function quarter() {
  window.resizeTo(window.screen.availWidth / 2, window.screen.availHeight / 2);
}
```

Specifications

Browser compatibility

Note: It's not possible to resize a window or tab that wasn't created by `window.open()`. It's also not possible to resize when the window has multiple tabs.

> **NOTE:** This function might not resize the window synchronously. In some environments (like mobile) it might not resize the window at all. You can listen to the resize event to see if/when the window got resized.
