

Status column

- [Custom post types](#)
-

The status column lets you quickly switch the status of field groups, custom post types, custom taxonomies, settings pages, and relationships between Publish and Draft without opening each item individually. You can enable this feature for posts of a custom post type as well.

The status column for the field groups

This feature adds a small toggle button directly to the management screen. Switch it **on** to publish, or **off** to save as a draft.

As a result, the traditional **Publish/Update** actions on the edit screens of field groups, custom post types, custom taxonomies, settings pages, and relationships are replaced with a single **Save Changes** button.

Custom post types

To add a status column to the table of the post list of a custom post type, when you [create that post type](#) with Meta Box, navigate to the **Features** tab, then enable the setting as below:

Enable the status column for the posts of custom post type

Then, you will see the Status column displayed. Turn the button on to publish or turn it off to save the post to a draft.

The status column of the posts

If your post type is not created by Meta Box, then you can use this filter to enable this feature for the post type:

```
add_filter( 'mbb_toggle_status_post_types', function( $post_types ) {  
    []$post_types[] = 'your-post-type-slug';  
    []return $post_types;  
} );
```
