

Automation in Nextcloud

There are different options to orchestrate automations in and with Nextcloud:

- [Flow](#) is a workflow engine included in Nextcloud to automate and streamline internal workflows. It can be used by both users for individual needs and administrators to set system-wide flows.
- With the [Windmill integration app](#) admin users can [connect a Windmill instance to Nextcloud](#) and orchestrate all flows and apps in Windmill.
- The [webhook implementation](#) allows administrators to set up webhooks that trigger actions in an external workflow orchestration software of their own choosing, e.g. Kestra, n8n or [Budibase](#).

“ ”

The External App Nextcloud Flow including a Windmill implementation is deprecated since Nextcloud 33 and not supported anymore. For documentation on this app, please refer to the corresponding documentation version.
