curl-error

curl_error

Return a string containing the last error for the current session

ENTITY

string

curl_error

CurlHandle

handle

Returns a clear text error message for the last cURL operation.

ENTITY

ENTITY

Returns the error message or `''` (the empty string) if no error occurred.

> [!NOTE] When a `CurlHandle` is executed via `curl_multi_exec`, this function returns `''` (the empty string) until `curl_multi_info_read` has returned the message for that handle. To retrieve the error string for each individual handle, pass the `result` key returned by `curl_multi_info_read` to `curl_strerror`.

ENTITY

`curl_error` example

```
<?php
// Create a curl handle to a non-existing location
$ch = curl_init('http://404.php.net/');
curl_setopt($ch, CURLOPT_RETURNTRANSFER, true);

if(curl_exec($ch) === false)
{
    echo 'Curl error: ' . curl_error($ch);
}
else
{
    echo 'Operation completed without any errors';
}
?>
```

ENTITY

`curl_errno`, `curl_strerror`, `curl_multi_info_read`, Curl error codes
