curl-strerror

curl_strerror

Return string describing the given error code

ENTITY

string

null

curl_strerror

int

error_code

Returns a text error message describing the given error code.

ENTITY

`error_code`
One of the cURL error codes constants.

ENTITY

Returns the error description. For an unknown error code this is `"Unknown error"`.

ENTITY

`curl_errno` example

```
<?php
// Create a curl handle with a misspelled protocol in URL
$ch = curl_init("htp://example.com/");
```

```
// Send request
curl_exec($ch);

// Check for errors and display the error message
if($errno = curl_errno($ch)) {
    $error_message = curl_strerror($errno);
    echo "cURL error ({$errno}):\n {$error_message}";
}
?>
```

ENTITY

```
cURL error (1):
 Unsupported protocol
```

ENTITY

`curl_errno`, `curl_error`, Curl error codes
