mb-parse-str

mb_parse_str

Parse GET/POST/COOKIE data and set global variable

ENTITY

bool

mb_parse_str

string

string

array

result

Parses GET/POST/COOKIE data and sets global variables. Since PHP does not provide raw POST/COOKIE data, it can only be used for GET data for now. It parses URL encoded data, detects encoding, converts coding to internal encoding and set values to the `result` `array` or global variables.

ENTITY

`string`
The URL encoded data.

`result`
An `array` containing decoded and character encoded converted values.

ENTITY

ENTITY

ENTITY

ENTITY	ENTITY
8.0.0	The second parameter was no longer optional.
7.2.0	Calling `mb_parse_str` without the second parameter was deprecated.

ENTITY

`mb_detect_order`, `mb_internal_encoding`
