Never

`never` is a return-only type indicating the function does not terminate. This means that it either calls `exit`, throws an exception, or is an infinite loop. Therefore, it cannot be part of a union type declaration. Available as of PHP 8.1.0.

A `return` statement in a `never` function is a compile-time error, even if the `return` would not be reached during execution. If control flow reaches the end of a `never` function without exiting, throwing an exception, or entering an infinite loop, a TypeError is thrown.

`never` is, in type theory parlance, the bottom type, meaning it is the subtype of every other type and can replace any other return type during inheritance.
