Launch

- Embed interactive product demos on websites.
- Embed demos in posts and pages with the WordPress Playground block
- Put a native app running WordPress in the App Store.

Reach your clients or customers faster. Showcase your product, let users try it live, or launch it in the App Store with zero lead time.

Embed interactive product demos on websites.

Leverage blueprints' potential to create interactive demos of your plugins or themes. For example, you can provide a link to your users/clients to showcase how your custom plugin integrates with an adapted theme, demonstrating their combined functionality and appearance.

Read more about this at How to use WordPress Playground for interactive demos

Get inspiration about the type of interactive demos you can create at the Blueprints Gallery

The Blueprints builder tool allows you edit your blueprint online and run it directly in a Playground instance.

Another handy tool to create a blueprint is the WordPress Playground Step Library tool that provides a visual interface to drag or click the steps to create a blueprint for WordPress Playground. You can also create your own steps!

Embed demos in posts and pages with the WordPress Playground block

This WordPress Playground block allows you to embed WordPress Playground in your posts and pages. You can also include an interactive code editor to demonstrate and teach your readers how WordPress plugins are built.

With this block you have a straightforward and effective way to create live WordPress environments that can be embedded within your blog posts.

For any issues or questions about the WordPress Playground Block, please open a GitHub issue in the playground-tools repository.

Put a native app running WordPress in the App Store.

Check the How to ship a real WordPress site in a native iOS app via Playground? guide for info on this use case
