sd_bus_message_append_strv

Attach an array of strings to a message

#include <systemd/sd-bus.h>

int sd_bus_message_append_strv

sd_bus_message *

m

char **

l

Description

The `sd_bus_message_append()` function can be used to append an array of strings to message `m`. The parameter `l` shall point to a `NULL`-terminated array of pointers to `NUL`-terminated strings. Each string must satisfy the same constraints as described for the `s` type in

`sd_bus_message_append_basic(3)`.

The memory pointed at by `p` and the contents of the strings themselves are copied into the memory area containing the message and may be changed after this call. Note that the signature of `l` parameter is to be treated as `const char *const *`, and the contents will not be modified.

Return Value

On success, this call returns 0 or a positive integer. On failure, a negative errno-style error code is returned.
