title: "WP-CLI" order: "1670"

Timber includes its own `wp timber` command for WP-CLI, the WordPress Command Line Interface.

Preparations

Before you can use the CLI, you need to install WP-CLI separately.

Commands

You can run the following CLI commands from the root directory of your WordPress installation.

If you need help with a command, use `wp help timber` or `wp help timber <command>`, e.g. `wp help timber clear-cache`.

`wp timber clear-cache`

Clears Timber and Twig caches. Runs `Timber\Cache\Cleaner::clear_cache()` in the background.

```
# Clear all caches.
wp timber clear-cache

# Clear Timber caches.
wp timber clear-cache timber

# Clear Twig caches.
wp timber clear-cache twig
```

Contributing commands

If you want to contribute more commands, we’re happy to receive pull requests to the Timber repository.
