bzpopmax

□□

- Examples

`BZPOPMAX` is the blocking variant of the sorted set `ZPOPMAX` primitive.

It is the blocking version because it blocks the connection when there are no members to pop from any of the given sorted sets. A member with the highest score is popped from first sorted set that is non-empty, with the given keys being checked in the order that they are given.

The `timeout` argument is interpreted as a double value specifying the maximum number of seconds to block. A timeout of zero can be used to block indefinitely.

See the BZPOPMIN documentation for the exact semantics, since `BZPOPMAX` is identical to `BZPOPMIN` with the only difference being that it pops members with the highest scores instead of popping the ones with the lowest scores.

Examples

```
127.0.0.1:6379> DEL zset1 zset2
(integer) 0
127.0.0.1:6379> ZADD zset1 0 a 1 b 2 c
(integer) 3
127.0.0.1:6379> BZPOPMAX zset1 zset2 0
1) "zset1"
2) "c"
3) "2"
```
