New patterns for media apps

Let's welcome our new collection of media patterns to help you create modern media experiences on the web for great audio and video playback:

1. Use the Web Audio API to add effects to audio sources.
2. Let the user control media playback on the lock screen, in a widget, or with hardware keys .
3. Record audio from the user's microphone.
4. Create a custom Picture-in-Picture button for your video player.
5. Record the user's screen.

We hope these patterns will help you build amazing apps, and we're looking forward to your feedback! You can provide feedback by tweeting at @ChromiumDev or filing an Issue.
