Redirects

□□

- Redirect a single page
- Redirect multiple pages in a directory

This guide explains how to redirect content.

Redirect a single page

1. Open `redirects.yaml`.
2. Add an entry similar to the following:

```
source: /path/to/old/page
destination: /path/to/new/page
```

Redirect multiple pages in a directory

It's possible to redirect a subdirectory of content, but this feature is probably no longer useful because web.dev now uses a flat URL structure.

1. Open `redirects.yaml`.
2. Add an entry similar to the following:

```
source: /path/to/old/subdirectory/:part
destination: /path/to/new/subdirectory/:part
```
