

WP_CLI::halt()

- [Usage](#)
 - [Notes](#)
 - [Related](#)
-

Halt script execution with a specific return code.

Usage

```
WP_CLI::halt( $return_code )
```

\$return_code (integer)
@return (never)

Notes

Permits script execution to be overloaded by `WP_CLI::runcommand()`

When `--debug` is enabled, this method will also output a backtrace showing where the halt was triggered from, making it easier to identify the cause of early termination.

Internal API documentation is generated from the WP-CLI codebase on every release. To suggest improvements, please submit a pull request.
