Lazy-loading editor component with automatic asset and settings management.

Overview

This package provides a single `<Editor>` component that handles all the complexity of loading and initializing the WordPress block editor. It automatically:

- **Loads editor assets** – Fetches and injects scripts and styles with proper dependency resolution
- **Loads editor settings** – Retrieves editor configuration from the REST API
- **Resolves global styles** – Applies theme.json styles based on the current template
- **Manages template contexts** – Automatically determines the correct template for the post being edited
- **Shows loading states** – Displays a spinner while assets and settings are being loaded

Installation

Install the module:

```
npm install @wordpress/lazy-editor --save
```

Usage

Basic Usage

```
import { Editor } from '@wordpress/lazy-editor';

function App() {
    return <Editor postType="page" postId="123" />;
}
```

That’s it! The component handles everything internally:
1. Resolves the template ID from the post type and ID
2. Resolves the styles ID from the template
3. Loads editor settings from `/wp-block-editor/v1/settings`
4. Loads editor assets from `/wp-block-editor/v1/assets`
5. Injects scripts and styles into the DOM
6. Renders the editor when ready

With Different Post Types

```
// Edit a post
<Editor postType="post" postId="42" />

// Edit a page
<Editor postType="page" postId="123" />

// Edit a template
<Editor postType="wp_template" postId="index" />

// Edit a custom post type
<Editor postType="product" postId="789" />
```
