title: is_graphql_http_request docType: function plugin: wp-graphql

is_graphql_http_request

```
is_graphql_http_request(): bool;
```

Whether a GraphQL HTTP request is in action or not. This is determined by checking if the request is occurring on the route defined for the GraphQL endpoint. This conditional should only be used for features that apply to HTTP requests. If you are going to apply filters to underlying WordPress core functionality that should affect *all* GraphQL requests, you should use "is_graphql_request" but if you need to apply filters only if the GraphQL request is an HTTP request, use this conditional. Default false.

- **Since:** 0.4.1
- **Source File:** `plugins/wp-graphql/access-functions.php`

Return

- `bool`: True when the current request is an HTTP request against the GraphQL endpoint, false otherwise.

Recipes

- Debugging JWT Authentication

Source

- `plugins/wp-graphql/access-functions.php:711`

```
function is_graphql_http_request(): bool {
```
